

### *Odor-Free water for you and your household.*

Impression Plus<sup>®</sup> Air Sulfur (IMPS) and Air Iron (IMPFE) filters are extremely effective in reducing hydrogen sulfide and iron, commonly associated with problem well water. These systems use a unique air-injection filtering technology to oxidize sulfur or iron into precipitates (solids) that can be readily filtered and reduced — the result is simply refreshing water from the tap, every time.

#### **Air Sulfur System Will:**

- Reduce sulfur and associated rotten egg odors
- Reduce turbidity

#### **Air Iron System Will:**

- Reduce iron
- Reduces red staining found on fixtures and appliances
- Reduce turbidity

Inch Worm is an adjustable cycle that allows the control valve to slowly "inch" its way into backwash, allowing air to escape slowly instead of one "rush."

Uses air to provide the oxygen supply which is then transformed into ozone through an electrical charge. The ozone is drawn into the water system's filter tank where it cleans the system.
